

Maintaining Your Boat

Boat Washing and Boat Wax

It is recommended that you wash your boat once or twice a week. This is to ensure that your boat's finish lasts for a long time. A lot of surface damage can be done to your boat by bird droppings, airborne industrial pollution, salt, and dirt. Your boat is made of different types of material such as canvas, fiberglass, and metal. This means that cleaning your boat requires that you pay attention to cleaning these specific materials. Different cleaners and cleansers are available for all materials, and be sure to check your local discount marine supplies store.

As for the boat wax, it is important because it maintains the value and look of your boat for the long run. There are different types of boat wax available, and most boat enthusiasts recommend a double layer application of paste wax. It is often suggested to get natural instead of chemical products, in order to preserve the finish of your boat.

Interior Boat Detailing

Interior boat detailing is a more extensive procedure than simple boat washing. It involves polishing different materials on your boat such as wood or metal. Special care should be extended to your windows and blinds as well. The interiors should be vacuumed. It is important to have steam-cleaning procedures done on your boat's carpet, canvas, and upholstery as well. This attention to detail can prevent termite and bacteria problems that deteriorate the quality, value, and performance of your boat. You should consider an early season professional cleaning which will allow you to more easily keep up with routine maintenance throughout the summer.

Boat Bottom Cleaning

While most boat maintenance services focus on the visible parts of your boat cleaning your boat bottom is equally important. The hull of your boat below the waterline should be routinely inspected and cleaned when necessary. The danger is that barnacles and algae will attach themselves to your boat bottom, affecting your boat's speed and performance. The more frequently you use your boat, the more it needs bottom cleaning. Most boating enthusiasts confirm that routine bottom cleaning saves fuel. Consider hiring professionals who apply chemical treatments to retard the fouling of your hull.
